
1) B2: tau = -inf trivial solution (TPR = FPR = 1.0, no discriminative power). 2) B6: constant-benign (TPR ~ 0 AND FPR = 0) → zero false alarms under zero detection carries NO information.
3) B1 ood TPR = 1.0 is structural (the 4 held-out encodings happen to be strong surface cues), not general capability. 4) B4: CPU tier (ratios unaffected by the latency/memory scale).
5) Ours = v2 @ fixed050 (star tier not shown, see T1); FPR is reported in T1. No ranking; no AUROC (B1/B3/B5/B6 have no continuous score); no long-input groups; no 'B6 comparable to Ours'.
